

■ Bitcoin Market Sentiment vs Trader Performance Analysis

Professional Data Analytics Project Report

■ Objective

Analyze whether Bitcoin market sentiment influences trader performance by combining historical trading data with the Fear & Greed Index and identifying trends through EDA.

■ Dataset Overview

Historical Trader Data: Timestamp, Symbol, Side, Leverage, Execution Price, Closed PnL.

Fear & Greed Index: Daily sentiment values including Fear, Extreme Fear, Greed and Extreme Greed.

■■ Methodology

1. Imported datasets with Pandas.
2. Cleaned missing and duplicate values.
3. Converted timestamps to datetime.
4. Merged datasets by date.
5. Performed EDA.
6. Created charts.
7. Generated insights.

■ Visualizations

Insert screenshots here:

- Average Closed PnL by Sentiment
- Fear vs Greed Distribution
- Closed PnL Histogram
- Additional Chart

Add a one-line explanation below each chart.

■ Key Insights

- Datasets merged successfully.
- Trading performance varied across sentiment.
- Some cryptocurrencies were traded more frequently.
- Higher leverage increased PnL variability.
- Market sentiment influenced trading behaviour.

■ Conclusion

The project successfully combined trading records with Bitcoin sentiment data to identify meaningful trends using Python, Pandas and visualization techniques.

Tools Used

Python • Pandas • NumPy • Matplotlib • Jupyter Notebook
